SANITARY SEWER REHABILITATION PROJECT

This notice aims to inform the resident that the Contractor, who is working under contract for Bridgestone Municipal Utility District (the District), will be installing cured-in-place pipe (CIPP) in the sanitary sewer system that serves your home during the next few weeks. If you received this notice on your door, the Contractor plans to perform the work in the vicinity of your home within the next 48-72 hours. **This work does not require residents to be home, and at no time will field crews have to enter your home or business.**

Field crews may require access to your property if a sewer manhole or similar structure is located in an easement on or adjacent to your property which may be located in your backyard. **Your cooperation in providing access is critical to the sanitary sewer repair process and is much appreciated. In that regard, if a manhole is in your backyard, we request that you please restrain or relocate pets and unlock gates from 8:00 a.m. to 5:00 p.m. during this period. If you have questions about whether a manhole is located in your backyard, please call your District Operator or Engineer, whose contact info is listed in the left column.**

CIPP is a rehabilitation method used to repair existing sanitary sewers that require little or no digging. CIPP involves inserting a flexible liner inside the existing pipe, inflating the liner, and exposing it to heat or ultraviolet light to dry and harden the liner inside the pipe. The liner forms a smooth surface inside the existing pipe, restoring it to near-new condition.

ACTION REQUESTED

We request that ALL residents who receive this letter do the following during the next 72 hours or until you no longer see the Contractor working in the area:

1. Unscrew your sanitary sewer service lateral clean-out cap. (This is located in your yard between the house and the sewer main, and it is usually a 4" threaded PVC plastic cap.) This will help prevent sewer smells from entering your house and the possibility of a sewer back-up into the house or building. Please note that your home may not have a clean-out cap, or it may be buried.
2. Minimize water usage. Please note that your water will not be turned off.
3. Place towels in sinks and bathtubs cover the drains, and close toilet lids.
4. Remove structures such as flowerpots, sheds, decks, bird baths, debris, etc., from on top of any sanitary sewer manhole on your property.

These actions are essential because private property connections to the public sewer will be temporarily sealed off during the pipe-lining process. Using less water is necessary to prevent water from filling up a private sewer line and backing up into a home during the pipe-lining process.

Please contact the District Engineer, Ryan Schilhab, with any questions regarding this project.
